

Two in three
Australians will
be diagnosed
with skin cancer
by the age of 70.

The FDA
approved drug
rapamycin
makes mice
live 60% longer

and, in some studies, reduces the risk of cancer.

Topical rapamycin could reduce the risk of getting skin cancer, and **adding rapamycin to**

sunscreen could be an effective way to deliver it. Liposomal rapamycin is one possibility. It is possible this will also make skin look younger with repeated use.
